

ICON STATES

NORMAL

Normal state of the driver associated with the event **Code No Longer Verified**. This state is usually represents an unverified code.

VERIFIED

Verified state is triggered every time the correct code is entered. The state's behavior varies between different code types.

LOCKOUT

Lockout state is triggered when consecutive incorrect codes entered exceed the limit set in **Tries Before Lockout** driver property.

CODE CHANGE

Code Change state is triggered every time the code is updated in the driver.

INCORRECT CODE

Incorrect Code state is triggered when wrong code is entered or when code is missing. Consecutive incorrect codes may trigger Lockout state.

OFFLINE

Offline state is triggered when the driver connections are incorrectly set up for code type. See Agent's **Features Summary** for more info.
