Arming/Disarming for V2 Security Proxies

Control4's V2 Security proxy added more security by hiding the user code in the driver. When a dealer wants to arm or disarm a security system in programming:

- Step 1 (Set user code in driver)
    - o Click on the driver and select the partition you want to control (you must do this for each partition you want to program in composer programming)

Partition - Settings	⌄
	Set Default
Use Locale Words	1

    - o Set the user code you want to use. We recommend have a separate user for Control4 so if the customer changes their code, the Control4 programming will continue to work

Partition - Settings	1 ⌄
Partition - ZonesInPartition	1-5,7
Partition - Label	Mi Casa
Partition - ExitDelay	8
Partition - EntryDelay	8
Partition - DefaultCode	••••

- Step 2 (Use Composer Programming for Arm/Disarm Action)
    - o Choose your event, then under actions, select the partition you want to arm/disarm and use this action.
