Overview

JellyFish Lighting makes premium permanent outdoor lighting that immediately adds curb appeal and character to your home or business! The system is capable of being used for nightly accent lighting that can also be a light source for your security cameras, or change to festive decorations for your favorite holidays and events with a few quick button clicks. Now you can easily manage JellyFish Lighting with your Control4 system with this Cindev created driver!

Setup

- Set up lighting zones prior to installation of the driver using the native application
- Install the controller driver
- Use the Network tab (under Composer's Connections section) to enter the IP address of the controller
- Verify that the driver property *Connection* is showing *Online* and that the *Name* and *Version* properties are populated
- Install a zone driver for each zone found in the controller
- Bind each zone driver to the zones listed under the controller's Connections
- Verify that the *Zone Name* property in the zone driver populates with the correct zone name
- Select the Extras View to be used by the zone (see *Extras View* documentation of the zone driver)
- Set up programming as needed

Properties

- *Cloud Status*: Displays driver license state
- *Driver Status*: Displays driver related information
- *Driver Version*: Displays driver version
- *Driver Actions*:
 - *Reset Driver*: Restores driver to its default state
 - *Refresh Controller Info*: Refreshes controller information including zone bindings
- *Automatic Updates*: Allows the *Cloud Driver* to automatically update the driver when a new version is available
- *Debug Mode*: Displays additional information on the lua tab for debugging purposes

JellyFish Controller Settings

- *Connection*: Displays the current connection status of the controller
- *Name*: Displays the name of the connected controller
- *Version*: Displays the firmware version of the connected controller

Dealer Notes

Zones do not have ids and therefore are tied to the zone name. If the zone is renamed after the setup of the driver the integration will fail for that zone until the zone driver is bound to the new connection. In order to create the new connection use the Driver Action *Refresh Controller Info*

Variables

- *Connection_Status* (STRING)
 - Online, Failed to Check In, Polling Started, Polling Stopped

- The current communication state of the driver
