

Supported Devices

The **Zigbee 3 Device** driver supports the **5150** models below, from **517** vendors. The controller pairs only Zigbee 3.0 devices, so check that a device's specifications say Zigbee 3.0: the first-generation Xiaomi and Aqara battery sensors listed here do not pair. The Third Reality 3RSP02028BZ and 3RVS01031Z units we tested did not finish joining. See Troubleshooting in the Zigbee 3 Device documentation.

- **Controls** are what you operate from Control4: each light, lock and relay (a multi-gang device has one per gang), the device's own **Settings**, and **Actions** such as a self-test. The driver adds a light, lock or relay only where the paired device reports one as it joins, so a device can show fewer than its row lists.
- **Sensors** are what the device reports: its readings and states, shown as variables and connections, and **Buttons**, whose presses are programming events and Button Link connections. A lock's **Lock events**, such as a wrong code entered at its keypad, are programming events.

A  means the model has none. A model made in more than one version lists only what every version has.
